C.I. FUNCTION.

C.I. FUNCTION.

C.I. FUNCTION.

C.I. FUNCTION.

C.I. FUNCTION.

C.I. CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1.

C.I. SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROPEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1 AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.

C.I. PTM: THE STRCTURAL PROTEINS C, E1 AND E2 ARE PRODUCED BY PROTEINTING PROCESSING BY THE HOST SIGNAL PEPTIDASE FAMILY C18.

C.I. SIMILARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY C18.

C.I. SIMILARITY: THE NS3 PROTEASE BELONGS TO PEPTIDASE FAMILY S29. X-RAY CRYSTALLOGRAPHY (2.1 ANGSTROMS) OF 1207-1657.

                                                                                                                                                                                                                                                                                                               NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1.
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C. AND MRNA.

The Taiwanese hepatitis C virus genome: sequence determination and mapping the S' termini of viral genomic and antigenomic RNA.",

RL Virology 188:102-113(192).

C - FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE TAINDORDOHOSIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

CC - CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

C - SUBMYT: THE VIRION OF THIS VIRIOS IS A NUCLEOCARSID COVERED BY A LIPOPROTEIN ENVELOPE CONSISTS OF TWO PROTEINS: PROTEIN AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF COMPLEX 
(EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivirin) (EC 3.4.21.98); Nonstructural protein NS4A (P4); Nonstructural protein NS4B (P27); Nonstructural protein NS5A (P56); Nonstructural protein NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)]. Hepatitis C virus (isolate Taiwan) (HCV).

"Nucleoride sequence of a cDNA that encodes a rice glutelin.";
Nucleic Acids Res. 17:3490-9490 (1989).
-:- FUNCTION: THIS IS A SEED STORAGE PROTEIN.
-:- SUBUNIT: HEXAMER; EACH SUBUNIT IS COMPOSED OF AN ACIDIC AND A BASIC CHAIN DERIVED FROM A SINGLE PRECURSOR AND LINKED BY A DISULFIDE BOND.
-:- SIMILARITY: BELONGS TO THE 11S SEED STORAGE PROTEIN (GLOBULINS)
Aspergillus fumigatus (Sartorya fumigata).

```
The present invention describes a method of inducing and/or sustaining an immunological cytotoxic T lymphocyte (CTL) response in a mammal. The method comppises: (a) delivering an antigen to the mammal at a level to induce an immunological CTL response in the mammal; and (b) maintaining the level of the antigen in the mammal's lymphatic system to maintain the immunologic CTL response. The method can be used for the delivery of e.g. a differentiation antigen, a tumnour-specific multilineage antigen, an embryonic antigen, an encogene antigen, a mutated tumour-suppressor gene antigen, or a viral antigen. They can be used for the treatment of disease such as cancer, e.g. malignant melanoma or infectious disease, e.g. viral disease such as hepatitis or AIDS. Sustained antigen delivery to the lymphatic system provides for potent CTL stimulation that takes place in the miliau of the lymphoid organ, and it sustains stimulation that is necessary to keep CTL active, cytotoxic and recirculating through the body. AAX10071 to AAX10639 represent examples of peptide antigens given in the present invention.
                                                                                                                                                                                        ;

The present invention describes a method of inducing and/or sustaining an immunological cytotoxic T lymphocyte (CTL) response in a mammal. The method comprises: (a) delivering an antigen to the mammal at a level to induce an immunological CTL response in the mammal; and (b) maintaining the level of the antigen in the mammal's lymphatic system to maintaining the immunologic CTL response. The method can be used for the delivery of e.g. a differentiation antigen, a tumour-specific multilineage antigen, an embryonic antigen, an oncogene antigen, a mutated tumour-suppressor gene antigen, or a viral antigen. They can be used for the treatment of disease such as cancer, e.g. maligant melanoma or infectious disease, e.g. viral disease such as hepatitis or AIDS. Sustained antigen delivery to the lymphatic system provides for potent CTL stimulation that takes collace in the miliau of the lymphoid organ, and it sustains stimulation that is necessary to keep CTL active, cytotoxic and recirculating through the body. AAX10071 to AAX10639 represent examples of peptide antigens given in the present invention.

New synthetic peptide specific for HCV antibodies - for detection of HCV or NANBHV e.g. by enzyme-linked immunosorbent assay and is immunogen for preparation of vaccines
                                                                                                                                                                                                                                                                                          This peptide is one of 19 specifically claimed antigens based on timmunoreactive regions of the envelope protein and non-structural proteins NS-1, NS-2, NS-3 and NS-5 for the Hepatitis C virus. The invention also concerns analogues, segments, mixtures, conjugates and polymers of these peptides. The C-terminal amino acid may be amidated. See AAR20751-R20782.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Peptide 12 based on immunoreactive region of Hepatitis C virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Non-A, non-B hepatitis virus; non-structural protein; vaccine.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This peptide is one of 19 specifically claimed antigens based on the immunoreactive regions of the envelope protein and non-structural proteins NS-1, NS-2, NS-3 and NS-5 for the Hepatitis C virus. The invention also concerns analogues, segments, mixtures, conjugates and polymers of these peptides. The C-terminal amino acid may be amidated. See AAR20751-R20782.

This peptide is the prototype peptide for design of synthetic peptides immunoreactive with Hepatitis C virus (HCV) antibodies against the NS-5 protein. The synthetic peptides containing substitutions as indicated in the FT above, can be used in a novel composition which comprises at least one linear or branched peptide (A) of formulae: P1-Y; P2-X; P4X2X; P8X4XXX; or P16X8X4XXX; Y = COOH or CONH2 at the peptide C terminus; X = residues of amino acids (aa), or analoques with 2 amino gps. and one COOH gp., each gp. able to form a peptide bond; P = peptide that is specifically immunoreactive with HCV antibodies. The compositions are used to detect HCV antibodies, e.g. for screening blood products, and to diagnose HCV infection by immunoasay of serum, tissue (extracts) and body fluids, pref. by ELISA, sandwich or passive haemagglutination tests.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          immunoreactive; HCV; Hepatitis C Virus; antibody; screening; blood; diagnose; infection; immunoassay; core protein; NS-4; NS-5.
                                                                                                                                                                                                                                                                                   This peptide is one of 19 specifically claimed antigens based on timmunoreactive regions of the envelope protein and non-structural proteins NS-1, NS-2, NS-3 and NS-5 for the Hepatitis C virus. The invention also concerns analogues, segments, mixtures, conjugates and polymers of these peptides. The C-terminal amino acid may be amidated. See AAR20751-R20782.
                                                                   New synthetic peptide specific for HCV antibodies - for detection of HCV or NANBHV e.g. by enzyme-linked immunosorbent assay and is immunogen for preparation of vaccines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Compsn. contg. synthetic peptide(s) reactive with hepatitis C related antibodies - used for screening blood and diagnosis of infection

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence is the peptide encoded by the hepatitis C virus (HCV) cDNA insert in clone 8f (see AAN90320). The polypeptides are used to diagnose HCV-induced NANBH, to raise antibodies for immunoassay or treatment, or to produce vaccines. The region shown overlaps with clone 14c.

                                                                                                                                                                                                                                                                                                                                                                              It is the sequence encoded in the hepatitis C virus (HCV) cDNA insert in clone 8f. Tag a = the region of overlap with the HCV antigen encoded in clone 14c. It is an epitope which could be used as immunoassay reagents and vaccines and to generate antibodies useful in diagnosis and passive immunotherapy for HCV infection/non-A, non-B hepatitis.

clone 36-1 containing a portion of the type-C hepatitis virus (RCV).

The sequence was one of 3 subfragments PCR-amplified from clone pET-36 using primers (AAQ73010-5). The resultant 614 bp fragment was ligated into lambda gill for expression of the polypeptide fragment was ligated into lambda gill for expression of the polypeptide fragment from clone plasmid pET-36 was constructed by inserting the DNA sequence from clone 36 (AAQ73003) in the vector pET3d. Clone 36, whose DNA was isolated by immunoscreening lambda-qill cDNA libraries made from the serum from one parenterally transmitted non-A, non-B hepatitis (PT-NANBH) chimpanzee and A PT-NANBH human patients, covers the sequence from bases 5010-6516 of the published HCV sequence and encodes a polypeptide of 504 amino acids. The polypeptides encoded by the DNA fragments can be used to generate antibodies to HCV antigens. The antibodies are useful for the detection of hepatitis type C antigens or for immunoprophylaxis. The polypeptides can also be used as vaccines effective against HCV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

Claim

```
This sequence represents the Hepatitis C virus (HCV) non-structural (NS4) protein. The invention relates to peptide analogues derived from HCV proteins, e.g. ANN67417-W67426, which can be used for the determination of anti-HCV antibodies in a sample. Preferably the peptide analogues contain one or more thioamide peptide bonds where at least one oxygen atom of the peptide bond is replaced by sulphur atom. The peptide analogues can be adsorbed or chemically bound to a carrier.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cDNA libraries were prepared from the serum of one HCV infected chimpanzee and 4 HCV infected humans. The 5 libraries were immunoscreened using HCV positive human and chimp sera. Inserts from HCV-immunopositive clones derived from chimp sera were characterised sexogenous to normal human PBL DNA. Two of these HCV clones were 36 corresponds to nucleotides 5010 to 6516 of the HCV sequence of clone 1 lambda gill clone of clone 35 in E.coli was deposited as ATCC 40901. See AAQ14276 (clone 40).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New hepatitis C virus epitope(s) immuno-reactive with HCV infected sera - useful for detection of HCV infections and as HCV

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The amino acid sequence of a portion of the type-C hepatitis virus (HCV) The corresponding DNA was isolated by the immunoscreening of lambda-gtill cDNA libraries made from the serum from one parenterally transmitted non-A, non-B hepatitis (PT-NANBH) chimpanzee and 4 PT-NANBH human patients. This clone, designated clone no. 36 covered the sequence from bases 5010-6516 of the published HCV sequence and encodes a polypeptide of 504 amino acids. This clone was inserted into the pET3d vector to generate clone pET-36. The published HCV sequence and encodes a polypeptide overlapping subfragments (AAQ73016-8) by PCR amplification using primers (AAQ73010-5). The polypeptides encoded by the DNA fragments can be used to generate antibodies to HCV antigens. The antibodies are useful for the detection of hepatitis type C antigens or for immunoprophylaxis. The polypeptides can also be used as vaccines effective against HCV.

                                                                                                                                                                                                                                                                                 Hepatitis C virus (HCV) antigens can be used for detecting HCV infected sera and individuals infected with HCV. They can also be used in an anti-HCV vaccine or for the production of anti-HCV antibodies which can be used for passive immunoprophylaxis. The antigens consistently identify more HCV positive serum samples with a high degree of specificity. See AAQ98202-14 and AAR81939-51.

                                                                                                                                                                                                PROCESS FOR THE DETERMINATION OF PEPTIDES
CORRESPONDING TO IMMUNOLOGICALLY IMPORTANT EPITOPES AND THEIR
IN A PROCESS FOR DETERMINATION OF ANTIBODIES OR BIOTINVLATED
PEPTIDES CORRESPONDING TO IMMUNOLOGICALLY IMPORTANT EPITOPES,
PROCESS FOR PREPARING THEM AND COMPOSITIONS CONTAINING THEM
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 383, Application US/08723425A
Patent No. 6165730
GENERAL INFORMATION:
APPLICANT: DELEYS, ROBERT
TITLE OF INVENTION: PROCESS FOR THE DETERMINATION OF
TITLE OF INVENTION: PEPTIDES CORRESPONDING TO IMMUNOLOGICALLY IMPORTANT
TITLE OF INVENTION: EPTIOPES AND THEIR USE IN A PROCESS FOR DETERMINATION OF
TITLE OF INVENTION: ANTIBODIES OR BIOTINYLATED PEPTIDES CORRESPONDING ...
NUMBER OF SEQUENCES: 453
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

Sequence 106, Application US/08262037

Sequence 106, Application US/08262037

Patent No. 5747239

GENERAL INFORMATION:
TITLE OF INVENTION: THE DETECTION OF ANTIBODIES TO HCV, DIAGNOSIS OF HCV
TITLE OF INVENTION: INFECTION AND PREVENTION THEREOF AS VACCINES

NUMBER OF SEQUENCES: 136

CORRESPONDENCE ADDRESS:
ADDRESSEE: MORGAN & FINNEGAN

STREET: 345 PARK AVE.

CITY: NEW YORK

Sequence 104, Application US/08262037

Patent No. 5747239

GENERAL INFORMATION:

GENERAL INFORMATION:

TITLE OF INVENTION: THE DETECTION OF ANTIBODIES TO HCV, DIAGNOSIS OF HCV

TITLE OF INVENTION: INPECTION ND PREVENTION THEREOF AS VACCINES

NUMBER OF SEQUENCES: 136

CORRESPONDENCE ADDRESS:

ADDRESSEE: MORGAN & FINNEGAN

STREET: 145 PARK AVE.

CITY: NEW YORK

STATE: NEW YORK
                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 45; DB 1; Length 47; 100.0%; Pred. No. 0.016;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    FILING DATE:

Patent No. 5747239

GENERAL INFORMATION:
APPLICANT: Chang YI Wang and Barbara Hosein
APPLICANT: Chang YI Wang and Barbara Bercific For
TITLE OF INVENTION: THE DETECTION OF ANTIBODIES TO HCV, DIACNOSIS OF HCV
TITLE OF INVENTION: INFECTION AND PREVENTION THEREOF AS VACCINES
NUMBER OF SEQUENCES: 136
CORRESPONDENCE ADDRESS:
ADDRESSEE: MORGAN & FINNEGAN
STREET: MAS PARK AVE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Polyprotein (clone 2248) - hepatitis C virus (isolate 22) (fragment)
C; Species: hepatitis C virus
C; Species: hepatitis C virus
C; Species: nepatitis C virus
C; Species: nepatitis C virus
C; Species: 31 Mar-1992 #sequence_revision 31-Mar-1992 #text_change 17-Nov-2000
C; Accession: PQ025 | 1991
B; Oshima, M.; Tsuchiya, M.; Yagasaki, M.; Orita, T.; Hasegawa, M.; Tomonoh, K.; Kojim J; Gen. Virol. 72, 2805-2809, 1991
A; Title: cDNA Aclones of Japanese hepatitis C virus genomes derived from a single pati A; Reference number: PQ0255 MJUD:92044457
A; Reference number: PQ0252
A; Molecule type: genomic RNA
A; Residues: 1-182 <OSH>
C; Superfamily: hepatitis C virus genome polyprotein
C; Keywords: polyprotein

LINCTION: PROTEASE NS2 IS RESPONSIBLE FOR THE CLEAVAGE OF NS2-NS3.

-!- FUNCTION: PROTEASE NS3 IS RESPONSIBLE FOR THE CLEAVAGE OF NS2-NS3.

-!- FUNCTION: PROTEASE NS3 IS RESPONSIBLE FOR THE CLEAVAGE OF NS3-NS4A, NA4A-NS4A, NA5A-NS5A AND NS5A-NS5B.

-!- FUNCTION: NS4A FORMS A COMPLEX WITH NS3 AND IS ESSENTIAL FOR THE ACTIVATION OF NS3.

-!- FUNCTION: NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.

-!- FUNCTION: NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.

-!- FUNCTION: NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.

-!- FUNCTION: NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.

-!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thi In Pl and Ser or Ala in Pl'.

-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEGCAPSID COVERED BY A LIPOPROTEIN BUVELODPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: EL CATALYTIC ACTIVATORY OF THIS VIRUS IS A NUCLEGCAPSID CONFINENT OF THIS DEPORTED BY A LIPOPROTEIN BUVELODPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: EL CATALYTIC ACTIVATORY OF THIS NUCLEOCAPSID IS A COMPLEX OF PROPERING DATA.
                                                                  01-AUG-1992 (Rel. 23, Created)
01-AUG-1992 (Rel. 23, Last sequence update)
16-OCT-2001 (Rel. 40, Last annotation update)
Genome polyprotein (Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protein P7: Nonstructural protein NS2 (P21)
(EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NS4A (P4); Nonstructural protein
NS4B (P27); Nonstructural protein NS5A (P56); Nonstructural protein
NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (Isolate H) (RC4).
Viruses; SSRNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            X-RAY CRYSTALLOGRAPHY (2.2 ANGSTROMS) OF 1192-1657.
